The Time Traveler

In the year 2147, time travel was nothing more than a theory. That was until Dr. Elena Reyes, a brilliant but reclusive physicist, built the world's first functional time machine. She kept her discovery a secret, hidden away in a nondescript laboratory on the outskirts of the city. Elena had worked for years on the project, obsessed with the possibilities of stepping through the folds of time.

Finally, after years of calculations and trials, her moment had arrived. The machine stood before her: a sleek, futuristic pod with a glowing control panel. It wasn't large or complicated—just big enough to send one person through time. Elena stared at it, her heart pounding. She had triple-checked everything. The year was set, the destination precise: June 12, 2127.

With a deep breath, Elena stepped into the pod, feeling the hum of the machine vibrate through her bones. She pressed the button, and the world around her warped, colors bleeding into each other until there was nothing but darkness.

inen, suddenly, light.
